

Ugljen

Ugljen predstavlja najstariji fosilni energetski resurs čije korištenje ima dugu tradiciju diljem svijeta. Mnoge zemlje, razvijene i one u razvoju oslanjale su se ili se još uvijek oslanjaju na njegovo korištenje u proizvodnji električne i toplinske energije. Prvenstvena prednost ugljena je njegova laka dostupnost, konkurentna cijena u odnosu na ostala fosilna goriva, velike rezerve i potpuna neovisnost o kriznim žarištima u svijetu. Postoje razne vrste ugljena koje se razlikuju po starosti i po kvaliteti kao je prikazano tablicom 1.

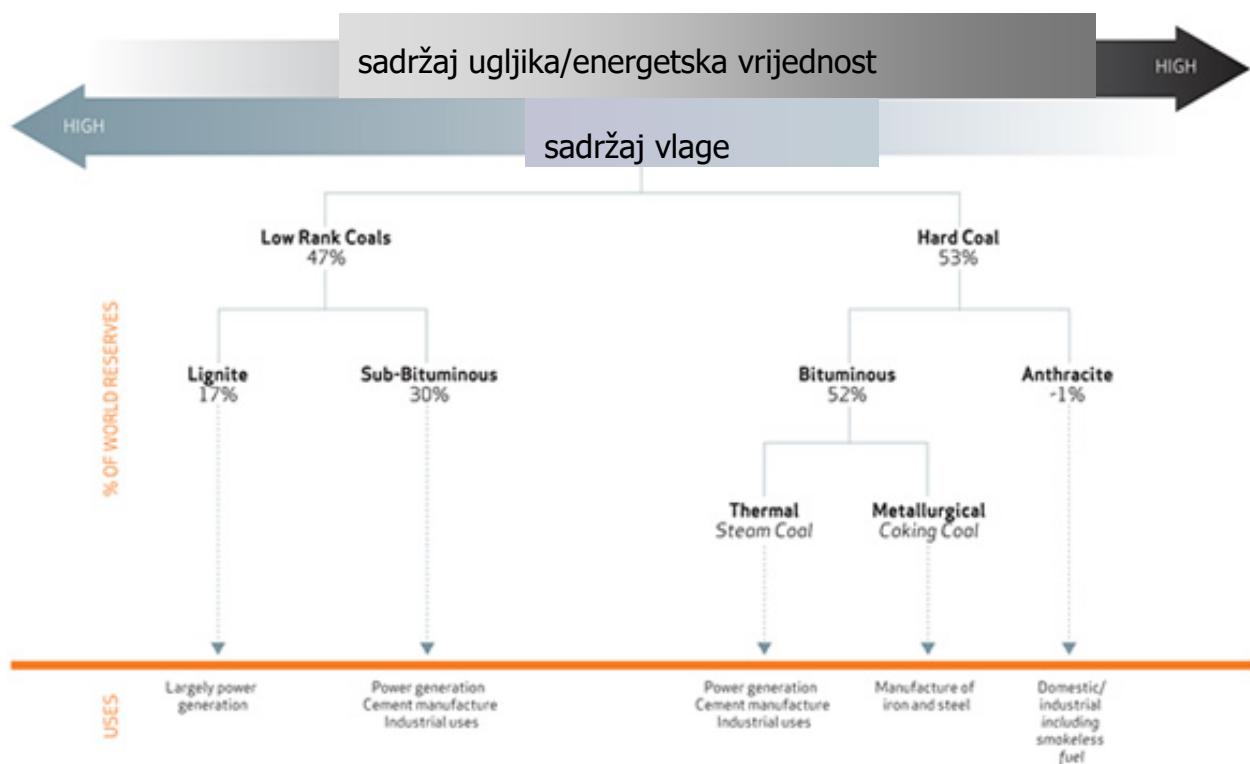

Tablica 1. Vrste ugljena i usporedba toplinske vrijednosti s drvom (H. Požar: Energetika)

	Gustoća, kg/m ³	Donja toplinska vrijednost, MJ/kg	Udio vlage,%	Hlapljivi sastojci, % suhe tvari	Udio ugljika, % suhe tvari
Drvo	0,2-1,3	14,7	Suhod.	80	50
Treset	1,0	6,3-8,4	60-90	65	55-65
Lignit	1,2	7,5-12,6	30-60	50-60	65-70
Mrki ugljen	1,25	16,7-29,3	10-30	45-50	70-80
Plameni kameni ugljen	1,3	29,3-33,5	3-10	17-45	80-90
Mršavi kameni ugljen	1,35	33,5-35,6	3-10	7-17	90-93
Antracit	1,4-1,6	35,6-37,7	1-2	4-7	93-98

Iz tablice je vidljivo da donja toplinska vrijednost ugljena raste s porastom udjela ugljika u suhoj tvari (isparen sav sadržaj vlage u ugljenu o čemu će biti više riječi u poglavljiju izgaranje) i što je niži udio vlage.

Uobičajena je i podjela ugljena na lignite, pod bituminozne, bituminozne i antracit kako je prikazano na slici 1. preuzetoj od World Coal Institute. Ta terminologija je uobičajena i prilikom navođenja statističkih pokazatelja. Kako je vidljivo lošiji ugljeni (low rank coal) su lignit i podbituminozni ugljen i zauzimaju gotovo pola svjetskih zaliha, a primjena im je u energetici.

Kvalitetni ugljeni (hard coal) su bituminozni i antracit. Bituminozni se koristi u energetici i metalurgiji, ali tada mora imati posebna svojstva. Antracit je najbolji od svih vrsta, ali i daleko najmanjih zaliha.

Slika 1 Uobičajena podjela ugljena obzirom na udio ugljika i vlage (World Coal Institute)

Tablica 2. prikazuje stanje svjetskih zaliha ugljena po državama i regijama a slika 3. udjele pojedinih regija u ukupnim svjetskim zalihamama. Najveće zalihe mogu se uočiti u SAD-u, Rusiji, Kini, Njemačkoj, Indiji, JAR-u itd. Po regijama (slika 3.) dominiraju Europa i europski dio Azije, dijelovi Azije i Pacifika (Kina, Indija, Australija), te Bliski Istok (s dominacijom Afrike tj. JAR-a). Na dnu tablice 2. vidljivo je da zemlje koje nisu članice OECD imaju najveće zalihe ugljena, a povezano s njihovim ubrzanim razvojem i sve većim potrebama za energijom, dovodi do realno velike globalne opasnosti po okoliš jer će se povećavati emisija CO₂ kao glavnog stakleničkog plina. I do sada su mnoge zemlje temeljile svoju energetiku na korištenju ugljena (tablica 3.) a to će vjerojatno činiti i dalje bez obzira na povećanje emisija stakleničkih plinova.

U tablici 2. i na slici 3. moguće je uočiti da rezerve ugljena s godinama postaju sve manje, za razliku od onoga što je viđeno s rezervama nafte i prirodnog plina. To ukazuje na činjenicu da su rezerve ugljena, kao najstarijeg fosilnog energenta dobro istražene i da se ne mogu očekivati otkrića novih nalazišta.

Tablica 2. Zalihe ugljena po zemljama u milijunima tona (BP statistical review 2017.)

Notes: Total proved reserves of coal – Generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known reservoirs under existing economic and operating conditions. The data series for total proved coal reserves does not necessarily meet the definitions, guidelines and practices used for determining proved reserves at company level, for instance as published by the US Securities and Exchange Commission, nor does it necessarily represent BP's view of proved reserves by country. Reserves-to-production (R/P) ratio – If the reserves remaining at the end of any year are divided by the production in that year, the result is the length of time that those remaining reserves would last if production were to continue at that rate.

Reserves-to-production (R/P) ratios are calculated excluding other solid fuels in reserves and production.

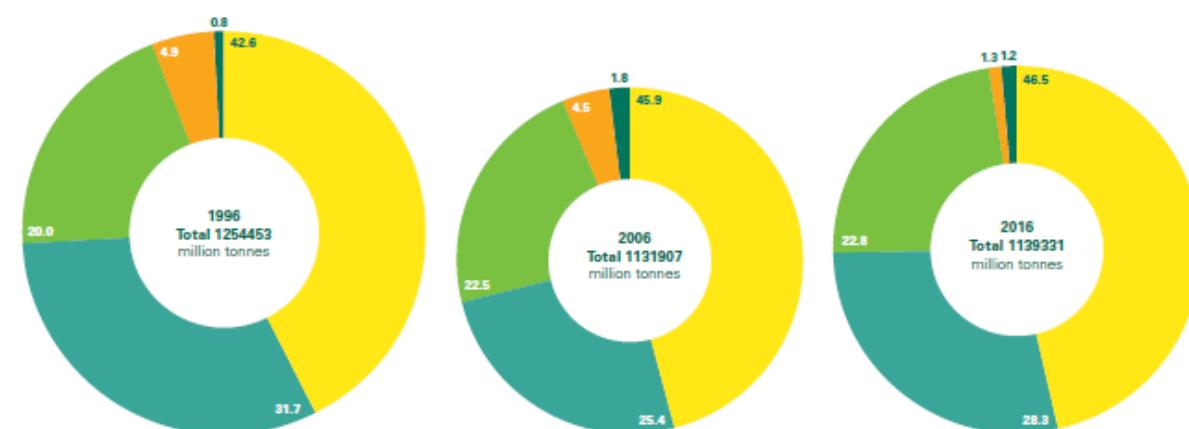

Shares of total and R/P ratios are calculated using million tonnes figures.

Source: Includes data from Federal Institute for Geosciences and Natural Resources (BGR) Energy Study 2016.

Distribution of proved reserves in 1996, 2006 and 2016

Slika 4. Proizvodnja i potrošnja ugljena po regijama

U tablici 6. vidljivo je da najveći proizvođači ugljena nisu nužno i najveći izvoznici jer očito sami potroše velike količine ugljena, a iz tablice 6. vidljivo je da neke zemlje veliki proizvođači također spadaju i među najveće uvoznike. Iz tablice 7. u kojoj se navode najveći uvoznici potrebno je istaknuti Japan kao zemlju koja potpuno ovisna o uvozu energenta, a tu činjenicu je dodatno pogoršala katastrofa u nuklearnoj elektrani u Fukushima 11. ožujka 2011. koju je razorio cunami izazvan snažnim potresom. Nakon toga je donesena odluka o postupnom gašenju svih nuklearnih elektrana u Japanu.

Tablica 6. Najveći izvoznici ugljena u 2014. (izvor World Coal Institute-IEA)

	Ukupno (od toga)	za energetiku	za čelik
Indonezija	410 Mt	408 Mt	2 Mt
Australija	375 Mt	195 Mt	180 Mt
Rusija	155 Mt	133 Mt	22 Mt
SAD	88 Mt	31 Mt	57 Mt
Kolumbija	80 Mt	79 Mt	1 Mt
Južna Afrika	76 Mt	76 Mt	0 Mt
Kanada	35 Mt	4 Mt	31 Mt

Tablica 7. Najveći uvoznici ugljena u 2013. (izvor World Coal Institute-IEA)

	Ukupno (od toga)	za energetiku	za čelik
Kina	292 Mt	229 Mt	63 Mt
Indija	239 Mt	189 Mt	50 Mt
Japan	188 Mt	137 Mt	51 Mt
Južna Koreja	131 Mt	97 Mt	34 Mt
Tajvan	67 Mt	60 Mt	7 Mt
Njemačka	57 Mt	47 Mt	10 Mt
UK	41 Mt	35 Mt	6 Mt

iako bi se na temelju prethodno iznesenih brojki i razmišljanja moglo očekivati stabilne cijene ugljene iz podataka danih u tablici 8. vidljivo je da to nije tako.

Uočljivo je veliko povećanje cijena na karakterističnim tržištima u razdoblju od dvadeset godina s izrazitim skokom u 2008. i 2011. godini.

Tablica 8. Cijene ugljena na karakterističnim točkama trgovanja
